

---ABSTRACT OF THE DISCLOSURE

8  
A twin-wire former for producing a fibrous web, such as a paper, board or tissue web, from a fibrous stock suspension. After a first deflection device, two endless wire belts are arranged to run upward at an angle to the horizontal reference such that an upper vertex of a second deflection is located above a lower vertex of the first deflection device, and, after separation of the two endless wire belts and after the second deflection device, one of the two endless wire belts carrying the forming web is arranged to run downward at an angle to the horizontal reference.---
